

Russell, Meinong and the origin of the theory of descriptions

Harm Boukema

INTRODUCTION

0.1 The unofficial versus the official view

Just as natural numbers have not been called natural until other, less natural ones were getting adopted, so the ‘official view’ on Russell’s famous Theory of Descriptions (ToD) has not been called official until fragments of another unofficial one began to emerge. The most obvious and striking feature of the official view consists in its attributing a prominent role to Meinong as *the* philosopher who actually has represented in its purest form the view the ToD is *opposed* to. Both the origin and the nature and the importance of Russell’s theory are supposed to be out-and-out anti-Meinongian.

Of course, this has nothing to do with personal animosity. As philosophers, people cannot be opposed to each other unless they agree on the very importance of the issue of their disagreement. A lot of proponents of the official view, such as Quine (1967) and Ayer (1971), have treated Meinong much less respectfully than Russell did. This even applies to Husserl and his followers who, in virtue of their being direct or indirect inheritors of Brentano took a stand much closer to Meinong.

The essence of the official view is not only determined by its content, but by the source of its authority as well. In the field of the history of philosophy there are a lot of official stories which have originated in a quite different way. For example, according to a widespread and rather tenacious interpretation, Berkeley’s idealism is supposed to be based on the maxim that being is being perceived (*esse est percipi*). Whatever the author of this view may be, he or she is certainly not Berkeley himself, but someone else.¹ In Russell’s case however, the situation is quite different. The official view on the ToD and its history is not just a piece of philosophical gossip whose prestige is mainly based on frequent and

inconsiderate repetition; it has been strongly promoted by Russell himself. What is more, he seems to be its very originator. In *My Mental Development* Russell wrote: “.....the desire to avoid Meinong’s unduly populous realm of being led me to the theory of descriptions.”(Russell, 1944, p.13) This feature of the official view has greatly contributed to its long-lasting dominance. Who dares to doubt the reliability of the story told by the very person who might be supposed to have been better acquainted with the real background and genesis of the ToD than anyone else in the whole world?

Indeed, without the help of new, unsuspected evidence no one could have mustered up enough courage to challenge Russell’s authority. The required support came from the manuscript *On Fundamentals* (OF) whose importance has been discovered by Coffa (1980). As appears unambiguously from this text, the ToD in fact was discovered on occasion of a problem which has no obvious connection with Meinong at all, namely the one raised by the question how a denoting concept can be made the subject of a proposition.

In subsequent years new, although somewhat more controversial evidence has been put forward against Russell’s account, most notably by Griffin (1996) who has argued that the supposed Meinongianism or quasi-Meinongianism Russell wanted to get rid of by means of the ToD, is merely fictitious. He concludes that

....contrary to what until recently was the almost unanimous view of philosophers, Russell’s reasons for adopting his new theory of definite descriptions in 1905 could have *nothing whatsoever* to do with the need to prune back an unduly populous realm of being.

(Griffin, (1996), p.57)

Others, such as Cartwright (1987) and Hylton (1990) have adopted similar views. Although I do not know for sure how much support the unofficial view has found among Russell scholars, I assume its authority has sufficiently increased to provoke the question in how far its example is worth following.

0.2 *The need for further criticism*

As far as I can see, there is one rather obvious reason for being suspicious of the belief that Russell's account is a mere myth. The importance of the fact, noted above, that the official story originated from its leading character, has been overlooked. In virtue of this fact, the emergence of the official view is itself part of the true history of the ToD. Therefore, if a considerable amount of painstaking exegetical and critical analysis results in a new, refreshing and stimulating view, it even cannot be plausible, unless it proves to be capable of explaining the remarkable and fascinating historical fact that the main actor himself has promoted another view. In so far Russell's own account deviates from what is supposed to be the true story, it asks for an explanation. What kind of motive might have enticed him to distort his own mental development?

The weakness of the newly established critical assessment of the official story not only consists in its failure to ask this question and to make an attempt at answering it, but just as well in its being so severe, that no room is left for any sound answer at all. If Russell's distortion of the historical facts is understandable, his account must at least contain some kernel of truth.

How could it possibly be detected? Not by means of a reactionary attempt at gluing together the debris left by the iconoclasts in order to rehabilitate the official view. On the contrary, the elements the official view consists of are to be subjected to further deconstruction in order to detect the smaller pieces that may fit into a coherent whole. The extremism of the newly established critical analysis is not due to its being too critical or too analytic, but rather to its being not critical and analytic enough. For the ideal shared by all who are seriously engaged in criticism, consists in the rejection of no less *and no more* than what on nearer scrutiny appears to be false. Trying to avoid the rejection of what only seems to be false is just as essential and important as trying to avoid the acceptance of what only seems to be true.

In the subsequent discussion I'll subject the official view to further analysis. I'll do so in trying to pay attention to all kinds of polarities. For the main idea behind my approach is, that neglecting them leads to confusion.

0.3 Preliminary analysis of the official view

Analysis cannot proceed without some data which constitute its raw material. I'll therefore start with more fully quoting the above mentioned passage from *My Mental Development*.

Having described how in June 1901 “the period of honeymoon delight” immediately after his visit to the International Congress of Philosophy in Paris came to an abrupt end by his discovery of the contradiction, Russell proceeds as follows:

At first, I hoped the matter was trivial and could be easily cleared up; but early hopes were succeeded by something very near to despair. Throughout 1903 and 1904, I pursued will-o'-the-wisps and made no progress. At last, in the spring of 1905, a different problem, which proved soluble, gave the first glimmer of hope. The problem was that of descriptions, and its solution suggested a new technique.

Scholastic realism was a metaphysical theory, but every metaphysical theory has a technical counterpart. I had been a realist in the scholastic or Platonic sense; I had thought that cardinal integers, for instance, have a timeless being. When integers were reduced to classes of classes, this being was transferred to classes. Meinong, whose work interested me, applied the arguments of realism to descriptive phrases. Everyone agrees that “the golden mountain does not exist” is a true proposition. But it has, apparently, a subject, “the golden mountain,” and if this subject did not designate some object, the proposition would seem to be meaningless. Meinong inferred that there is a golden mountain, which is golden and a mountain, but does not exist. He even thought that the existent golden mountain is existent, but does not exist. This did not satisfy me, and the desire to avoid Meinong's unduly populous realm of being led me to the theory of descriptions. What was of importance in this theory was the discovery that, in analysing a significant sentence, one must not assume that each separate word or phrase has significance on its own account. “The golden mountain” can be part of a significant sentence, but is not significant in isolation. It soon appeared that class-symbols could be treated like descriptions, i.e., as non-significant parts of significant sentences. This made it possible to see, in a general way, how a solution of the contradictions might be possible. The particular solution offered in *Principia Mathematica* had various defects, but at any rate it showed that the logician is not presented with a complete *impasse*. (Russell, 1944, pp. 13-14)

The general tenor of this exposition is quite clear. Russell primarily wants to explain how he managed to cope with the paradox. In this connection the ToD comes in.

Although that theory was not discovered on occasion of the paradox but on occasion of another problem, “the problem of description”, later on the new technique it provided proved to be of great importance in paving the way out of the impasse. So two different questions are answered in one stroke, namely “What was the decisive development leading to the solution of the contradiction?” and “What is the main logical importance of the ToD?”

What is the role of Meinong in this connection? Evidently, he is supposed to represent a canonical variant of excessive realism. The ToD made it possible to circumvent ontological extravagance. What is more, it actually originated from “the desire to avoid Meinong’s unduly populous realm of being”. In saying so, Russell of course, does not want to reveal an unsuspected feature of the ToD, but rather to add a little extra to the importance of a connection with which all readers who ever studied the ToD, are supposed to be familiar. For it is a remarkable fact indeed that, although Russell’s numerous expositions of the ToD differ significantly from each other in several respects, one element is to be found in all of them, namely a criticism of Meinong which is very nearly the same as the one expounded in this passage.² So, the essential point of Russell’s notorious remark is that this criticism is of pivotal importance not only to the nature and the foundation or *justification* of the ToD, but to its *genesis* as well.

This distinction between genesis and justification may in a quite obvious way lead to another similar one, namely the distinction between the *conception* en the *adoption* of the ToD. It is, I think, quite significant that both Russell and the proponents of the unofficial view have failed to make it. What Russell meant or at least suggested in saying that he was *led* to the ToD by his “desire to avoid Meinong’s unduly populous realm of being” evidently is, that on occasion of “the problem of descriptions”, a problem raised by his former theory of descriptions (the theory of denoting concepts put forward in *The Principles of Mathematics* (POM), Chapter V and connected with Meinong, he *conceived and fully accepted* his second theory of descriptions which *afterwards* appeared quite essential to the solution of the paradox.

The essential elements contained in this story seem to be as follows:

- a1) Meinong actually represented an extreme and excessive realism.
- a2) After his turn from idealism to full realism and before the discovery of the ToD, Russell had adopted at least some views very similar to those of Meinong.

b1) These Meinongian or quasi-Meinongian elements were essentially connected with Russell's theory of denoting concepts.

b2) On occasion of a difficulty in that theory, his desire to avoid his own Meinongianism arose.

c1) This desire led to the conception of a new theory of denoting, the ToD.

c2) Immediately after its conception, this new theory was fully and wholeheartedly accepted.

c3) Afterwards the link with the paradox was discovered.

As far as I can see, these elements constitute the meaning of the official view. In order to separate their truth from their falsity I'll distinguish three varieties of Meinongianism. The first one, *trans-realism*, will be discussed in section 1. Something like it is actually to be found in *Principles*. Section 2 will be concerned with the second variety: Meinong's *essentialism*. Neither it, nor something like it, is compatible with Russell's realism. In section 3 I'll argue that the manifest connection with the theory of denoting concepts is merely accidental. Inspired by Frege, Russell made use of the theory in order to get rid of his own former quasi-Meinongianism. In section 4 the third, essentially hidden variety of Meinongianism is taken into account. Russell's discovery of this *crypto-Meinongianism*, which took place after the ToD had been conceived and rejected, contributed to the *adoption* of the ToD, but was not sufficient to give rise to its full acceptance. The ideological character of the official story is not due to its claim that the ToD is out and out anti-Meinongian, but rather to its suppressing both the retardation of the ToD's adoption and the problem which caused this retardation.

1 QUASI-MEINONGIANISM IN THE CONTEXT OF RUSSELL'S REALISM

1.1 Meinong's 'excessive realism'

Meinong would fiercely protest against being depicted as a proponent of a realism which is more excessive than its Russellian or Fregean variant. Typical of Meinong's theory of objects is not, as is suggested in the passage quoted in the previous section, an attempt

to allow the intrusion of new and strange denizens into the realm of being, but rather to extend the range of possible thought and knowledge to objects *beyond* that realm.

In one important respect Meinong's realism is even less excessive than the one adhered to by Frege and Russell. For he refuses to attribute reality to false propositions, whereas according to Frege and Russell these are just as real as true ones. It is quite essential to Meinong's point of view that the complexity of propositions or 'objectives' as he calls them, is to be taken with a pinch of salt. Just as a real state of affairs may concern something unreal, so a state of affairs concerning something real may itself be unreal³.

I do not want to suggest that Russell was completely unaware of these points. The latter is mentioned and extensively discussed in Russell, 1904, pp. 471-474, the first seems to be acknowledged in OD where Russell much more fairly renders Meinong's view in saying:

Thus 'the present King of France', 'the round square', etc., are supposed to be genuine objects. It is admitted that such objects do not *subsist*, but nevertheless they are supposed to be objects. (Russell, 1905 d, p.418)

Nevertheless, the fact that 39 years later Russell spoke of 'Meinong's unduly populous realm of being' instead of Meinong's unduly populous realm of *objects*, is not due to a merely insignificant slip of his pen. What he wants to convey is more complicated than he suggests, because it evidently not only bears on his opponent, but on himself as well. Russell and Meinong both assume that any object of possible thought or knowledge is as subject matter, or as *term* as Russell calls it, involved in true and false propositions. Whatever may be thought of is such that some propositions about it are true and others are false. For if we suppose some object to be such that it stands alone, isolated from all propositions, then it would in virtue of that very circumstance be involved in the proposition that it is not involved in any proposition.⁴ Conversely, whatever occurs as term in some proposition could possibly be thought of. Russell and Meinong also share the conviction that beyond that realm of objects, i.e. beyond the realm of what *may* occur as object of thought and what *actually* occurs as term in propositions, there is absolutely nothing.

However, they disagree on the question how this all-embracing, transcendental realm is related to the realm of being. According to Russell, they are co-extensive, according to Meinong, they are not. Never, neither when he wrote *Principles*, nor when he afterwards

extensively studied the works of Meinong, nor, of course after the adoption of the ToD, did Russell feel any inclination to accept objects without being.

Being is that which belongs to every conceivable term, to every possible object of thought – in short to everything that can possibly occur in any proposition, true or false, and to all such propositions themselves. Being belongs to whatever can be counted. If *A* be any term that can be counted as one, it is plain that *A* is something, and therefore that *A* is. “*A* is not” must always be either false or meaningless. For if *A* were nothing, it could not be said not to be; “*A* is not” implies that there is a term *A* whose being is denied, and hence that *A* is. Thus unless “*A* is not” be an empty sound, it must be false – whatever *A* may be, it certainly is. (Russell 1903 a, p. 449)

This view is at odds with the very starting point of Meinong’s theory of objects, for that consists in the assumption that although it is always inconsistent to say of something that it is not something or not an object, it is far from inconsistent to say that something is not real and has no being.

However, Meinong has never succeeded in convincing Russell of this view. In December 1904 Russell writes to him:

I have always believed until now that every object must in some sense have *being*, and I find it difficult to admit unreal objects. (Lackey, 1973, p.16)

We are now in a position to understand, at least partly, Russell’s somewhat puzzling slip of the pen in *My Mental Development*.⁵ As seen from the point of view of his persistent traditional and un-Meinongian conviction that the notion of being is transcendental and coextensive with the notion of object or term of a proposition, Meinong’s attempt to extend the realm of objects beyond being amounts to the same as an attempt to overcrowd the realm of being.

1.2 Russell’s realism

Meinong’s trans-realism, his attempt to stand up for both the epistemological importance and the unreality of unreal objects, is part of a larger philosophical project. He

is dissatisfied with traditional metaphysics because in his opinion it does not succeed in fulfilling its own promise to be the most universal of all sciences. Meinong wants to free it from its established confinements in order to widen its scope⁶.

In this respect there is a very remarkable similarity with Russell's turn from traditional idealism to his revolutionary absolute and unrestricted realism. Due to the established inclination to overrate Moore's positive and Bradley's negative contribution to this revolution and to underrate Leibniz's part which is both positive and negative, this similarity has often been overlooked. However stimulating the new ideas of Moore might have been to Russell, it is Leibniz, not Moore, who made him aware of the *logical* principle involved in *all* kinds of *metaphysical* idealism, not only in the particular one propounded by Leibniz, but also, to mention two important examples, in Bradley's holistic monism and in Russell's former pluralistic holism, namely that *eventually every proposition must have a subject and a predicate*:

In the belief that propositions must, in the last analysis, have a subject and a predicate, Leibniz does not differ either from his predecessors or from his successors. Any philosophy which uses either Substance or the Absolute will be found, on inspection, to depend upon this belief. Kant's belief in an unknowable thing-in-itself was largely due to the same theory. It cannot be denied, therefore, that the doctrine is important. Philosophers have differed, not so much in respect of belief in its truth, as in respect of their consistency in carrying it out. In this latter respect, Leibniz deserves credit.

(Russell 1900, p. 15)

What does the "belief that propositions must, in the last analysis, have a subject and a predicate" have to do with idealism? And why does its rejection lead to realism? Here we meet the second obstacle that might prevent us from understanding the nature of Russell's realism. These questions cannot be answered as long as the classical Aristotelian and Kantian view of logic as a kind of formal proto-science which precedes real knowledge and does not involve any metaphysical assumptions, is taken for granted. But there are good reasons not to do so, for Russell never subscribed to such a view, neither during⁷ nor after his idealist period. Therefore, the subject-predicate principle is to be construed as logico-metaphysical in character. There is one, and as far as I can see only one, way to meet this requirement: by taking into account the notion of *substance*.

The principle Leibniz made Russell aware of bears on the connection between *truth and being*. Whatever is true is eventually, “in the last analysis”⁸, true about what is supposed to be the only really real kind of thing, namely a concrete existent, a *substance*. Single substances are, in virtue of their being ‘in themselves’ and not in something else, the ultimate subjects of propositions. And what is true about them, consists in their being qualified, in their having predicates which are supposed to be their private properties. These predicates or ‘accidents’ are not in themselves. The only way they are is to be in the substance they belong to. Their *esse* is *in-esse*.

In my opinion, the idealism Russell is opposed to is not primarily epistemological in character, as Hylton, 2004, pp. 207-212 has suggested, but metaphysical. It involves the exclusion of all kinds of things from the realm of real being. Whatever cannot be construed as a concrete individual or as one of its private properties must be unreal, or at least not fully real. It is relegated to the realm of the merely *ideal*, i.e. the realm of abstract conceptual deviations from reality which may point to it because they are derived from it, but do not properly belong to it.

What kinds of items are deemed to dwell in this limbo? Universals, relations, propositions (especially false ones), space, time, infinity and last but not least: plurality. And these, of course, are exactly the things Russell is anxious to allow unrestricted entrance in the realm of being. Just as idealism is based on *restricted* aboutness of propositions, so the main philosophical principle underlying the logic of POM claims their *unrestricted* aboutness.

However, Russell’s realism is not unlimited without qualification. It does not at random attribute being to whatever might supposed to be real, but, at least as far as logic is concerned, only to those items that *must* be acknowledged because they are *presupposed* in the very assumption that they are not. For example, there *must* be truth, for if there were no truth, it would be true that there is no truth. Also: there *must* be many truths, for if there were only one truth, then that very truth would be the only one there is, which is absurd. For the sake of brevity, I’ll call this feature of Russell’s realism *reflexive determinism*.

1.3 Russell’s quasi-Meinongianism

We are now in a position to allow due weight to the context in which the most notable piece of evidence in favour of Russell's supposed 'Meinongianism' occurs, namely the passage from *Principles* subsequent to the one quoted in 1.1. There Russell says:

Numbers, the Homeric gods, relations, chimaeras and four-dimensional spaces all have being, for if they were not entities of a kind, we could make no propositions about them. Thus being is a general attribute of everything, and to mention anything is to show that it is.

Existence, on the contrary, is the prerogative of some only amongst beings. To exist is to have a specific relation to existence – a relation, by the way, which existence itself does not have. This shows, incidentally, the weakness of the existential theory of judgment – the theory, that is, that every proposition is concerned with something that exists. For if this theory were true, it would still be true that existence itself is an entity, and it must be admitted that existence does not exist. Thus the consideration of existence itself leads to non-existential propositions, and so contradicts the theory. The theory seems, in fact, to have arisen from neglect of the distinction between existence and being. Yet this distinction is essential, if we are ever to deny the existence of anything. For what does not exist must be something, or it would be meaningless to deny its existence; and hence we need the concept of being, as that which belongs even to the non-existent. (Russell 1903 a, pp. 449-50)

The larger context of this passage will be discussed in 2.3. For the present purpose it is sufficient to note that Russell is arguing against one of the main points implied by the idealist principle mentioned in the previous section, the restriction of the aboutness of propositions to *existents* or, what amounts to the same, to substances and their accidents.⁹ In order to prove that this restriction is intolerable, Russell makes use of his favourite reflexive mode of argument: If it were true that whatever is true is true of some existent, then it would be true as well that existence belongs to all entities. That very supposed truth however would itself be an example of a proposition concerning a non-existent universal.

Therefore, being is wider than existence. Although a sentence of the form "A is not" can never express a true proposition, a sentence of the form "A does not exist" may quite well do so, for example "Existence does not exist". And of course, it is quite easy to give

similar examples Russell might have had in mind, such as: “The relation ‘greater than’ does not exist” or “The number 2 does not exist”.

As far as these and similar examples are concerned, Russell’s contention is quite innocent. Both Meinong and Frege would agree with him. But no doubt Russell also wants his view to be applied to examples of a different kind, such as “Zeus does not exist” or “Pegasus does not exist”. At least, that seems to be implied by the first part of the text quoted above. For according to Russell Homeric gods are entities because and in so far as they can be mentioned. And mentioning a Homeric god of course does not consist in the use of the phrase “Homeric god” or of some denoting phrase derived from it, but in the use of one of the divine proper names that actually occur in Homer’s *Iliad* or *Odyssey*.¹⁰

If this exegesis is right, the Russell of *Principles*, without having either Meinong or Frege in mind, takes a stand halfway between them. According to Frege “Zeus” is not a genuine proper name at all. It only seems to name someone. Fairy tales and mythological stories are neither true nor false, although they may be supposed to be in conflict with science and sober-minded common sense. Discussions on the question whether it is really true that Zeus dwells on top of the Olympus, are based on a wrong presupposition about the language in which those stories are expressed, namely that the expression “Zeus” really names something.

Russell’s argument runs in the opposite direction. According to him it is evident that the proposition expressed in the sentence “Zeus does not exist” is not concerned with language, but with a real non-existent entity named Zeus. There *must* be such an entity otherwise the said proposition could not be true.

Meinong is in agreement with Russell’s view that “Zeus” is a real proper name, but neither, of course, that it names something real, nor that it needs to do so in order to be a real name at all. According to him existence is not to be conceived as an extra prerogative which may or may not be added to being, but rather as one of two mutually exclusive modes of being. Whatever is, either exists or subsists. A sentence such as “Existence does not exist” may indeed in the context of a philosophical discussion be used in order to correct a possible category mistake. In saying that Zeus does not exist, however, we mean something quite different, namely that Zeus lacks the only way of being he is susceptible to. Therefore his non-existence amounts to the same as his non-being. In short, as seen from Meinong’s perspective, Russell is guilty of excessive realism!

2 QUASI-MEINONGIANISM WITHOUT ESSENTIALISM

2.1 *The possibility of quasi-Meinongianism without essentialism*

Let us now, leaving aside the disagreement between Russell and Meinong, focus on what they have in common. Both accept that “Zeus” is a genuine proper name standing for a non-existent object. They agree on the truth of the proposition that Zeus does not exist. What other propositions about Zeus are supposed to be true? Take for example the proposition that according to Greek mythology Zeus, assuming the form of a white bull, carried off a pretty nymph called Europa. Both Russell and Meinong, I presume, would accept its truth without further ado.

But what about the supposed fact that Zeus abducted the said nymph? Is it a real fact? According to Meinong it is! Why so? Why not assume that the supposed facts concerning Zeus are just as unreal as Zeus himself? Such a view seems much more appropriate to a philosopher who wants to speak in defence of the unreal!

The importance of this rather obvious question has been overlooked by both the adherents of the official view and their opponents. Ayer and Quine assume as a matter of course that it is impossible to allow fictional characters or Homeric gods to be genuine objects without giving credit to all established stories that purport to be about them. Applied to the Russell of *Principles* this amounts to the same as assuming that *if* he concedes that Homeric gods and chimaeras are entities – and, as appears from the text quoted in the previous section, there is overwhelming evidence in favour of that assumption – *then* he must suppose propositional functions such as ‘x is a god dwelling at the top of the Olympus’ or ‘x is a chimaera’ to be true for some values of x.

However, as Griffin, 1996, p.49 has pointed out, these adherents of the official view just ignore that according to POM section 73, p.74 ‘chimaera’ is a null-class concept, i.e.

the propositional function 'x is a chimaera' is false for all entities. Taking this textual evidence as point of departure, Griffin argues in the opposite direction, concluding that Russell's supposed quasi-Meinongianism must be a myth. Indeed, as Griffin is prepared to admit, this challenging conclusion asks for a new interpretation of Russell's saying that chimaeras are entities. And he actually provides an ingenious one (p.54), namely that Russell failed to use inverted commas. What he actually meant is not that chimaeras are entities, but rather that *denoting concepts* derived from the class concept 'chimaera', such as 'all chimaeras' or 'some chimaeras', are entities.

As far as I can see, it is quite implausible that Russell failed to use the very italics or inverted commas which according to POM section 56, p.53 are of utmost logical importance. Furthermore, neither in section 427 where chimaeras are actually said to be entities, nor in any other part of the chapter to which that section belongs, denoting concepts are at issue. Finally, if Griffin's exegesis were right, Russell could just as well have mentioned things like even prime numbers greater than 2. Ignoring the fact that he did not do so, amounts to ignoring the main point of the text, namely that being is not confined to existence.

As soon as the assumption shared by Griffin and his opponents is abandoned, another much less far-fetched solution appears to be possible. The inverted commas Russell could have used are rather *scare quotes*. What is more, it is quite understandable that he did not use them, for according to the dictionary a chimaera is something that *according to ancient Greek stories* is a creature with a lion's head, a goat's body and a snake's tail that can exhale fire. And as far as Homeric gods are concerned, there is no need of scare quotes at all, because Homer occurs in their definition. Of course, in saying that 'chimaera' is a null class concept, Russell did not mean that there are no entities which according to ancient Greek stories are such and such, but rather that there are no entities which are such as ancient Greek mythology supposes them to be. After all, why would Russell's firm belief in the aboutness of Greek mythology force him to believe in Greek mythology itself?

2.2 Russell's realism versus Meinong's essentialism

Against this interpretation a serious objection could be raised, namely that it imputes a very strange and abstract, not to say inconsistent belief in characterless characters to Russell. This difficulty may help us to get down to the very heart of the matter. For if the

Russell of *Principles* actually held the view I attribute to him, Meinong would strongly disagree. Why? That, in fact, is the very same question as the one asked in the previous section. So let us now try to answer it.

Meinong would blame Russell for crypto-psychologism. For the assumption that, apart from the fact that Zeus does not exist, all real facts concerning him involve human imagination and belief, seems to be very near psychologism. It implies that the nature (*Sosein*) of the object called Zeus would be wholly determined by the mental acts performed by the Greeks. In short, as seen from Meinong's perspective, the view I attribute to Russell is an inconsistent and half-hearted mixture of objectivism and subjectivism. On the one hand Zeus would be some particular object whose identity is fixed independently of human thought. On the other hand his being such and such would merely consist in his actually being supposed to be so and so by certain people.

Most philosophers are prone to thinking that whatever is unreal is either in the mind or somehow created by it. According to Meinong this view is inconsistent. For whatever is in the mind must be a real part of a real mental process. And whatever is produced by the mind must be real as well. Creation cannot be real unless it results in something real. Although unreal objects are outside being, they must in some way or other be in *touch* with being. Unreal objects need to be propped up by real facts concerning them in order to be objects at all. But these facts cannot all of them be mental. The only facts that may provide the needed support are *Soseinsobjektive*, i.e. facts constituting their essence, their being *what* they are. Zeus for example derives his identity from the fact that he is male, not female, super-human, not just one among mortals, master of thunder and lightning, not of love or fertility.

Whether this argument is sound or not, it certainly is not trivial or superficial. Moreover, it clearly reveals that Meinong's theory of objects is the outcome of two mutually opposed and intimately connected forces: one out-going and trans-realist, the other restricting and realist. The latter is liable to overshadow the first. And that - of course - has substantially contributed to the creation of the image discussed in 1.1: Meinong as the somewhat ridiculous and half-hearted philosopher who, starting from an unduly credulous attitude to fairy-tales, wanted to add new denizens to the realm of being.

In 1.3 I have argued that, although Russell never was prepared to accept unreal objects, it is quite essential to the trans-existential tenor of his realism, that it leaves room for something *like* Meinong's trans-realism. The final question to be answered in this section

is, whether the same holds of Meinong's essentialism. Is it or anything like it compatible with the nature of Russell's realism?

Let us start with the first part of this question. As outlined above, Meinong's essentialism is based on the idea that objects need to have *intrinsic* properties in order to be distinct objects at all. Because distinctness or difference is a relation, this assumption may be viewed as a particular application of the general principle that "every relation is grounded in the nature of the related terms". It goes without saying that this *axiom of internal relations*, as Russell called it, is incompatible with the very essence of his realism.¹¹

How is this conflict to be accounted for? How is it possible that, in virtue of his being a realist, Russell is opposed to Meinong's essentialism, which in its turn seems to be essentially realist in character? Either the term "realism" is used unambiguously. In that case their clash must be of minor importance. Or some unexplained ambiguity is involved. But then the common ground required for a substantial disagreement seems to disappear.

This dilemma is based on the assumption that Russell's realism is itself pure and unambiguous. In fact however, it has a peculiar kind of 'unrealism' as its own inner counterpart just as Meinong's trans-realism appeared to have a certain kind of realism as its counterpart. In *My Philosophical Development*, Russell says:

All the arguments used by Hegelians to condemn the sort of things dealt with by mathematics and physics depended upon the axiom of internal relations.

Consequently, when I rejected this axiom, I began to believe everything the Hegelians disbelieved. This gave me a very full universe. (Russell, 1959, p.48)

As far as universals, relations, numbers and similar things are concerned, this is true. They are indeed freed from the grip of substantial possessiveness. But this also implies that the supposed concrete possessors are transformed into rather bare and abstract individuals. As seen from the perspective of a down-to-earth Aristotelian, they are made *unreal*. And they must be made so in virtue of Russell's assumption that universals and relations lose their independent reality as soon as they are supposed to be capable of being embodied *in* individuals. As seen from Russell's point of view, Meinong turns out to be a crypto-idealist as soon as he takes the traditional notion of *in-esse* for granted in assuming that individuals need perforce a characteristic nature in order to be individuals at all.

2.3 The context of section 427

It is a remarkable and revealing fact that the notorious section 427 in which chimaeras and Homeric gods are ranked among entities, is part of a chapter on *Logical arguments against Points*. This chapter is almost entirely devoted to a criticism of Lotze, who takes a stand close to Leibniz and also close to the idealist Russell, although the latter is not mentioned by the Russell of *Principles*.¹²

One of the canonical idealist arguments against the possible reality of empty space is that apart from the different things that occupy space, all points are exactly alike. They seem to be different, but their difference consists in nothing at all. Points are colourless and without character. Or, as the idealist Russell used to say, there is a conception of diversity without diversity of conception. The realist Russell's retort is:

To be exactly alike can only mean – as in Leibniz's Identity of Indiscernibles – not to have different predicates. But when once it is recognised that there is no essential distinction between subjects and predicates, it is seen that any two simple terms differ immediately – they are two, and this is the sum-total of their differences. (Russell, 1903 a, p.451)

In saying that “there is no essential distinction between subjects and predicates” Russell means that any predicate, and more generally any constituent of a proposition, may occur as genuine subject. For according to him the *in-esse* which marks the traditional absolute distinction between substances and their accidents is to be rejected.

This argument may also be applied to Homeric gods. Apart from all the stories told about them, they are indeed exactly alike. But that does not prevent them from differing immediately from each other. Therefore, the very same argument that seemed to be a serious objection to my interpretation, namely that it forces upon Russell the strange and unacceptable view that fictional characters are in themselves colourless entities, in fact forces upon him a view much too commonsensical and Aristotelian to be compatible with the radical externalist stand of his logic. Maybe this externalism is to be rejected, but if so, not in virtue of its being at odds with common sense but in virtue of its possible inconsistency. And if it is to be rejected, that cannot be a sound reason for denying that Russell ever adhered to it.

But another objection could be raised, namely that I have overstressed the importance of the context in which section 427 occurs. After all, in the passage quoted above, reference is made to the simplicity of points. In this respect the comparison with Homeric gods seems to fail. For even if Zeus is supposed neither to have nor to need any intrinsic properties, some kind of complexity cannot be denied him. If he existed, his beard would be one of his constituents.

Indeed, I am prepared to admit that there is, according to the Russell of *Principles*, something peculiar to points and similar things such as simple concepts, namely that if A is a definite point, the propositional function 'x is a proper part of A' is false for all values of x. If, leaving aside the difficulties involved in Zeus's being a pseudo-existent, we substitute for A a really existent complex entity such as Mont Blanc, then its snowfields and rocks satisfy the said function.

But – and that is the sticking point – Russell's realism involves another stricter and more important notion of complexity which is opposed to a wider and equally important notion of simplicity. This appears from the chapter on *Whole and Part*, where classes and propositions are said to be the *only* complex entities (POM section 135, p. 139). In view of the fact that both classes and propositions are abstract, non-existent entities, it may be inferred that all existents, such as Mont Blanc, are simple in the wider and more fundamental sense of that word.

Why so? Because in order to understand a proposition about Mont Blanc, for example that it is over 4000 metres high, you need not be acquainted with its snowfields and rocks. These do not occur in the Mont Blanc itself, but only in other propositions concerning that mountain and its parts.¹³ However, in order to understand a *proposition*, be it about Mont Blanc or about something else, you need to be acquainted with its constituents. For the identity of a proposition is essentially determined by them, i.e. by the entities occurring *in* it.

True, the same holds for classes. Just as propositions, they differ indirectly from each other, in virtue of the immediate differences between their constituents. Yet propositions play a much more prominent role. For they may differ in another respect as well, namely in virtue of the way their constituents are arranged, as appears from '5>3' and '3>5'. And in view of the fact that whole and part are strictly correlative (POM section 133, p.137), this prerogative does not injure, but rather *enhances* the unity of propositions. As compared to them, classes are weak *both* in unity *and* in complexity.

Indeed, being the only entities that are supposed to reveal something like what Hegelians used to call “unity in difference”, propositions are successors and deputies of substances. Just as according to traditional metaphysics whatever is, either is a substance or is in a substance¹⁴, so, according to Russell’s realism, whatever is, either is a proposition or occurs in it. But, of course, propositions are much less possessive, because they are prepared both to share their constituents with at least some of their fellow propositions and to occur as constituent in some others.

Russell’s externalism implies as its inner limit and foundation something like Meinong’s essentialism. And there are, I think, sound Wittgensteinian reasons to suppose this quasi-essentialism to be more consequential than Russell was prepared to admit. But, whether this presumption may be right or not, this quasi-essentialism or ‘internalism’ does, even if it is strengthened in Tractarian fashion, not make Russell a bit more Meinongian or quasi- Meinongian. For although he is prepared to concede to more commonsensical philosophers that there are a lot of colourful entities, revealing a rich variety of properties and interrelated parts, he is not prepared to admit that anything else than propositions belongs to them. His view is rather, that in so far as we think to see complex structured things around us, we actually see complex whole propositions concerning simple and unstructured entities which immediately differ from each other.

As far as I can see, it is this wider notion of simplicity that Russell had in mind in the text quoted above. It ranges over all entities which can be presented to the mind by means of a proper name, i.e. an expression whose complexity is logically irrelevant. As seen from this perspective, comparing Homeric gods with points is much more to the point than might be supposed at first.

3 THE ACCIDENTAL LINK WITH THE THEORY OF DENOTING CONCEPTS

3.1 Russell’s quasi-Meinongianism as accidental and independent of the theory of denoting

Thus far I have argued for the actual *existence* of Russell’s quasi-Meinongianism. I have done so in making use of a rather uncommon view on the nature of Russell’s realism, or

rather on the way it is opposed to his former idealism. In this connection two aspects of his realism appeared to play a prominent role. Its Platonic trans-existential import *prompted* Russell to quasi-Meinongian extravagance, its externalist slant *restricted* it in such a way as to make it compatible with the quite un-Meinongian concession that Homeric gods and chimaeras do not and need not have the properties ascribed to them by Greek mythology.

But, however important these two features of Russell's realism may be for the nature and limitations of his quasi-Meinongianism, they neither *forced* him to adopt it, nor *prevented* him from actually doing so. This indeed, is quite essential to the view I argue for. Russell's manifest quasi-Meinongianism, although surrounded by fundamental ideas, is itself not fundamental at all. It does not reveal any manifest deep-rooted ontological extravagance, but rather a quite superficial and momentary extravagance in giving examples of non-existent entities. Russell's argument against Lotze would have been just as good as it is, if he had refrained from allowing Homeric gods and chimaeras entrance in the realm of being.

The theory of denoting concepts is not able to add anything to the limited importance of Russell's quasi-Meinongianism. For although that theory presupposes that there are Russellian proper names, it itself is not concerned with them. Once the view is adopted that "Zeus" is a genuine proper name, the distinction between meaning and denotation cannot be applied to it. That, indeed, is one of the most conspicuous and notorious differences with Frege's theory of sense and reference. However, the Russellian reason behind it has often been overlooked.

It is to be found in the third feature of Russell's realism: its *radical pluralism*. According to the logic underlying all metaphysics of substance, whatever is true is, in the last analysis, true of *single* substances. This principle did not prevent many philosophers such as Aristotle, Descartes, Leibniz, Lotze and the idealist Russell from adopting many substances. But – and that is one of the discoveries Russell made in studying Leibniz – such pluralism is in fact half-hearted and inconsistent.¹⁵ For the very supposed fact that there are many substances cannot be reduced to many facts about single substances. Only *together* they are many. All numerical propositions, such as 'Brown and Jones are two' are of utmost importance to the principles of mathematics. Yet they do not fit into the mould of the singular subject predicate proposition. Even monists like Spinoza and Bradley, who are to be honoured for their attempt to more consistently carrying out the logic of

substance, are unable to fully banish all plurality. Therefore, the logic of substance is to be rejected.

As appears unambiguously from POM chapter V, numerical and similar propositions constitute the quite un-Fregean background of Russell's theory of denoting. Of decisive importance in this connection is the consideration that mathematics as *human* science about the *infinite* would be impossible if all plural propositions were of the same enumerative kind as the ones about Brown and Jones. That is the reason why in POM section 141, p.145 Russell says that "the logical purpose which is served by the theory of denoting is, to enable propositions of finite complexity to deal with infinite classes of terms."

So-called definite descriptions, introduced by means of the class as one, are deemed to be of minor importance. But in their case as well *contrast in complexity*, although back to front, plays an essential role, especially in the years after the completion of *Principles*. And, as I have argued in the preceding section, in the case of proper names, there is, according to Russell, no contrast of complexity at all. Indeed, in Frege's theory as well, complexity is taken into account, in a quite different way: Mont Blanc itself cannot occur in a thought (Gedanke) about it in virtue of its supposed complexity.¹⁶

3.2 *The theory of denoting concepts as first aid*

Although the theory of denoting is unable to support the existence of Russell's quasi-Meinongian extravagance, or its non-existence, or its emergence, or even the desire to avoid it, nevertheless, once, for some reason or other, its emergence has actually taken place and, for some other reason, the desire to effectuate its disappearance is awakened, the said theory could possibly be of great help. What is more, it seems to be the only available assistant authority. For if Russell wants to banish Zeus and his congeners from the realm of being, he will have to give up his former belief that "Zeus" and similar expressions are genuine proper names. And in that case there are only two possible options. Either such an expression is supposed to have no logically relevant signification at all, or it is supposed to be a denoting phrase in disguise, which *expresses* a complex meaning (made up of all the properties which according to Meinong are essential to Zeus), but does not *denote* anything. It goes without saying that the latter alternative is to be preferred.

As far as I know, the manuscript *On Meaning and Denotation*, written in the second half of 1903, is the earliest text that testifies to the actual existence of such a move:

Such phrases as “Arthur Balfour”, “two”, “yellow”, “whiteness”, “good”, “diversity”, and single words generally, designate without expressing: in these cases, there is only a single object for the phrase, namely the object which it designates. But when a phrase contains several words, not simply juxtaposed, but in any way combined so as to acquire unity, then the phrase, as a rule, expresses a complex meaning. In such a case, there may be no object designated: for example, “the present king of France” expresses a meaning, but does not designate an object. The same holds of “the even prime other than 2”, “the rational square root of 2”, “the bed in which Charles I died”, or “the difference between Mr. Arthur Balfour and the present Prime Minister of England”. In all such cases, the meaning expressed is perfectly intelligible, but nothing whatever is designated. In the case of imaginary persons or places, such as Odysseus or Utopia, the same is true. These appear to be proper names, but as a matter of fact they are not so. “Odysseus” may be taken to *mean* “the hero of the Odyssey”, where the *meaning* of this phrase is involved, and not the imagined object designated. If the Odyssey were history, and not fiction, it would be the designation that would be in question: “Odysseus” would then not express a meaning, but would designate a person, and “the hero of the Odyssey” would not be identical in *meaning* with Odysseus, but would be identical in designation. And so in the other cases, “the present King of England”, “the even prime”, “the positive square root of 2”, “the bed in which Cromwell died”, “the difference between Mr. Chamberlain and the present Prime Minister of England”, are all phrases which have both meaning and designation. (Russell 1903 b, p.318)

What might have caused Russell’s desire to get rid of his own quasi-Meinongianism? If, as I have argued in 3.1, it is not much more than an insignificant lapse, then the desire to correct it need not be very fundamental either. Anyhow, it seems to be occasioned by Russell’s study of the works of Frege and Meinong. The example of Odysseus seems to be borrowed from Frege’s *Über Sinn und Bedeutung*.¹⁷

As far as reasons or incentives are concerned, both an anti-Meinongian and a pro-Fregean and a properly Russellian, self-critical one might have played a role.

- 1) In *Principles* Meinong is only mentioned in connection with Weber’s law. Therefore, not until he actually studied Meinong’s theory of objects, did Russell

realise that the view he held had some similarity with that much more sweeping theory. So he might have started, I guess, to criticize this rather grotesque enlargement of his own view in the following way: Evidently, Meinong fails to distinguish sufficiently between single proper names and complex denoting phrases. Indeed, a genuine proper name cannot fail to name something, but a denoting phrase (not only according to OD, but according to POM p.74 as well) may quite well be denoting and yet not denote anything. The question whether a denoting phrase actually denotes something, presupposes that it does express a denoting concept, i.e. a concept derived in a particular way from a class-concept, for that question bears on the extension of the class-concept the denoting concept is derived from. Ignoring the difference between the question whether the distinction between meaning and designation can be applied to a certain phrase and the question whether a phrase actually designates something, leads to evident contradictions, as Meinong's own example of the round square shows. Although Russell's criticism of other philosophers, such as his criticism of Lotze, often happens to be concealed self-criticism, in this argument, put forward in his *Review of Meinong and others*, in OD, in numerous subsequent expositions of the ToD and last but not least in *My Mental Development*, Russell is only involved as subject of criticism, not as its object, at least not in any obvious way. But it might have occasioned him to the following self-criticism: "Just as Meinong unduly trusts denoting phrases, so I (Russell) have unduly trusted purported proper names such as "Odysseus"".

- 2) This leads to the un-Meinongian view adopted by Frege (see 1.3). The fact that Frege cares as little as Meinong does about the distinction between proper names and unambiguously denoting phrases, does not matter. For his main idea only concerns the *application* of the theory of sense and reference, not its un-Russellian essence. Therefore, Frege's way of dealing with fictional discourse can be smoothly integrated with the theory of denoting concepts. Furthermore, being less philistine than the one implied by Russell's quasi-Meinongianism, it is preferable. After all, Homer's works are not to be assessed as historical records.
- 3) From the first part of the text quoted above, it might be inferred that according to Russell all proper names of abstract entities are derived from single words. If

this conjecture is right, expressions such as “Odysseus” or “Zeus” cannot be construed as proper names of non-existent entities. For whatever their etymology may be, they are not used as nominalisations of single words. And because they are, of course, just as little proper names of existent entities, they cannot be proper names at all.

3.3 *The insufficiency of the quasi-Fregean solution*

Is the aid lent by the quasi-Fregean variant of the theory of denoting concepts sufficient to satisfy Russell’s desire to get rid of his former quasi-Meinongianism? In order to answer this question, it may be helpful to split up Russell into three personalities: the quasi-Meinongian, the desiring and the quasi-Fregean one.

The quasi-Meinongian Russell does not labour under any constraint. True, he supposes himself to be forced to accept Zeus’s being, but the unavoidability of that is accepted with just as little reluctance as Zeus’s being itself. For stoical acceptance of the necessity of reflexive determinism (see 1.2), affords the freedom to deny existence, for example the existence of Zeus. And Russell’s opponent, the idealist Lotze, has to go without this freedom because he wrongly supposes himself to be free to refuse the said necessity.

As seen from the point of view of the desiring, unsatisfied Russell, being forced to accept Zeus’s being actually is a constraint. He wants to get rid both of Zeus’s being and the supposed force that forced him to accept it. In fact, he wants to get *more freedom* than the freedom to deny existence, namely *the freedom to deny being as well*. And that, after all, might be a very *deep* desire concealed under the surface of the rather superficial ones discussed in the previous section.¹⁸

Is the quasi-Fregean Russell able to fulfil this deeper need? According to Peter Hylton he is:

If we have a sentence containing the name or the definite description “A” then, as before, if the sentence is meaningful it must express a proposition. Given the theory of denoting concepts, however, this proposition need not contain the object A itself; it may, rather, contain a denoting concept which denotes A (or purports to do so). There

being a proposition of that kind, however, does not require that there actually be such an object as *A* (or at least the requirement is by no means obvious).

It now becomes possible for the sentence “*A* is not” to be both meaningful and true – i.e., to be meaningful even though there is no such thing as *A*. The difference is that now *A* need not be counted among the constituents of the proposition; instead of containing an object (*A*), the proposition is now said to contain a denoting concept which, as it happens, does not denote anything. (Hylton 2004, pp.216-17)

Hylton, I presume, is prepared to admit that a sentence such as “Zeus abducted Europa” will express a proposition which is neither true nor false, as soon as “Zeus” is construed as a denoting phrase in disguise. So, in general, the quasi-Fregean solution will result in truth-value gaps. But, at least that is how I understand Hylton, there is one exception: the sentence “Zeus is not” will express a true proposition, because its not being about anything at all seems to provide the very reason for its being true!

To me, this interpretation is too paradoxical and I can hardly believe that Russell would have accepted it. Anyhow, Hylton deserves credit for having discussed *the* crucial question which indeed must be answered affirmatively if the unofficial view is to be rescued in another way than the one proposed by Griffin. And if the first aim I have set myself (see 0.2) is attainable, if it is possible to lay bare a substantial kernel of truth contained in the official view, than Hylton’s solution is to be rejected.

What might lend credibility to his view is the fact that the proposition expressed by “The god of thunder and lightning dwelling at the top of the Olympus *is not*” seems to be equivalent to the proposition that ‘the god of thunder and lightning dwelling at the top of the Olympus’ (i.e. *the denoting concept*) *has no denotation*. This solution, although never put forward by Frege, would be quite Fregean in spirit. For it is based on the un-Meinongian principle, used long before the introduction of the distinction between sense and reference, that the problem of non-being is to be avoided in translating non-being into non-*having* and changing the subject matter accordingly.¹⁹ Evidently the viability of such an eliminative paraphrase is based on the un-Russellian assumption that equivalent sentences always express one and the same proposition.²⁰ Finally, this approach is based on Frege’s belief that any sense may occur as subject of a proposition by means of *the* indirect sense, which is supposed to be in some way derived from the direct sense, as is indicated by the inverted commas.

From this discussion it may be inferred, pace Hylton, that the amount of latent insufficiency contained in the quasi-Fregean solution, is large enough to prove that its possible discovery could have played a significant role in Russell's mental development. What is more, although we know that such a discovery did not actually lead to the conception of the ToD, nevertheless it *could* have done so. For the discussion of the Meinongian issue of non-being eventually leads to essentially the same problem as the one that actually occasioned the discovery of the ToD, the problem concerning the indirect sense and the explanation of the inverted commas. The connection is much more intimate than suggested in OD and probably even more intimate than Russell ever realised. Indeed, Russell's possible discovery of the inadequacy of his quasi-Fregean solution, if it took place at all, did not contribute to the *conception* and birth of the ToD, but such a discovery, although postnatal, could quite well have contributed to its *acceptance*.

The previous discussion may also show that Frege is on *both sides* of the problem concerning the denial of Zeus's being. He seems to be both the cause of the problem and the inspiring provider of possible, although rather un-Russellian devices that could be helpful to its solution. Of course, Frege cannot play those two conflicting roles in virtue of one and the same quality. So, let us call the Frege who lent first but insufficient aid, the orthodox one and the Frege who possibly could lend sufficient second aid, the unorthodox one. Indeed, it is quite well-known that the ToD is Fregean, or rather trans-Fregean in character. It makes use of Fregean criticism of language in order to go beyond the limits of the actual Frege. For its quintessence might be summarized in saying that it treats *the* in the same fashion as *all* and *some* had been treated by Frege long before.²¹

Strangely enough, Frege does not play any role in the official story. But whatever the right explanation of this fact may be,²² Frege's actual importance does not take away anything from Meinong's possible importance. For the insufficiency of the orthodox Frege's assistance in banishing quasi-Meinongianism might be due to his being too close to Meinong. He might be tainted with *crypto-Meinongianism*. In 4.2 I'll try to show that such a discovery is actually expressed in OD. But before doing so, I'll try to sketch Russell's preceding trans-Fregean discoveries in due order.

4 CONCEPTION AND DELAYED ADOPTION OF THE ToD

4.1 *Trans-Fregean discoveries*

As appears from POM, section 476, p.502, Russell initially rejected Frege's notion of indirect sense. He did so not because it involves an infinite regress, but because he supposed it to be superfluous. For he rather inconsiderately assumed that a denoting concept may occur as term of a proposition more or less in the same way as other concepts may. "If we wish to speak of the [denoting] concept, we have to indicate the fact by italics or inverted commas." (POM, section 56, p.53). Inverted commas are deemed to merely indicate a change in *occurrence*.

From 1903 onwards Russell begins to realise that the peculiar way denoting concepts primarily occur, namely in a subject-position without being the subject of a proposition, prevents them from being made the subject of a proposition in the same way as a predicate or a relation.²³ So he comes to see the need of something like Frege's indirect sense. In order to become the subject of a proposition, a complex denoting concept C has to occur in another, larger denoting concept 'C' which denotes C. The inverted commas are now supposed to indicate an *addition*.

It is quite essential in this connection, that, although the larger denoting concept 'C' always has to be *definitely* denoting, the denoting concept C which is supposed to be denoted by 'C', may just as well be *ambiguously* denoting. In the manuscript OF, p. 381, Russell more or less accidentally hits on the question of how the supposed additional inverted commas are to be *explained*. In making an attempt to answer this question, he discovers that they cannot be explained at all, because all denoting concepts, whether they do or do not occur in another denoting concept, occur in an entity position anyhow, i.e. as denoting.

In discussing the nature of this unsuspected problem, Russell makes an unmarked change from ambiguously denoting concepts such as 'any man' (his very first example) to definitely denoting concepts such as 'the centre of mass of the Solar System' (OF, p.383). Then he makes a second discovery. In the case of unambiguously denoting concepts, the problem concerning the explanation of the inverted commas can be avoided by means of a (quasi-Fregean) eliminative paraphrase. For the proposition that 'the S' denotes something, is equivalent to and therefore, at least according Frege's assumption, identical with the proposition that the class-concept S or the propositional function 'x is an S' *has*

one and only one instance. And that may be expressed by means of quantifiers in the way indicated by Frege himself.²⁴ Applying this procedure to sentences of the form “The S is P” leads to the ToD. This then is the way the new theory is *conceived*.

In the very same section, Russell also discovers another possible *advantage* of the ToD, namely that it may explain the informative character of identity statements in a much better way than the old theory of denoting concepts did. However, a few pages later the brand-new theory is *rejected*:

The most convenient view might seem to be to take *everything* and *anything* as primitive ideas, putting

$(x). \phi 'x. =. \phi '(everything)$

$(x). \phi 'x. =. \phi '(anything).$

But it seems that on this view *everything* and *anything* are denoting concepts involving all the difficulties considered in 35-39 [i.e. the problem concerning the inverted commas], on account of which we adopted the theory of 40 [The ToD]. We shall have to distinguish between “everything” and everything, i.e. we shall have: “everything” is not everything, but only one thing. Also we shall find that if we attempt to say anything about the *meaning* of “everything”, we must do so by means of a denoting concept which denotes that meaning, and which must not contain that meaning occurring as entity, since when it occurs as entity it stands for its denotation, which is not what we want. These objections, to all appearance, are as fatal here as they were in regard to *the*. Thus it is better to find some other theory. (Russell 1905c, p.385)

Russell realizes that the problem concerning the inverted commas is much more general than the ToD seems to suppose. It is indeed possible to eliminate by means of quantifiers and bound variables other kinds of denoting concepts as well, such as ‘all men’, ‘some men’ etc., but *not* ‘any man’. For according to POM p.91 *any* is intimately connected with the *variable*. Indeed, as seen from Frege’s perspective, the variable is supposed to have no meaning on its own account. But that amounts to the same as reducing propositions about anything to singular propositions about propositional functions. However appealing such a view may be from a purely technical perspective, it is at variance with the

very principle of Russell's realism, set out in 1.2 and especially with the radical pluralism discussed in 3.1.

4.2 *The discovery of crypto-Meinongianism*

In OD however, Russell appears to be much more self-confident about the viability of the ToD. He decides to take the variable as fundamental and irreducible. The reduction of all kinds of ambiguously denoting phrases, save the ones beginning with the word "any", to sentences containing bound variables, is set out without any critical discussion of the former theory of denoting concepts. The main part of the text is devoted to definite descriptions. In a somewhat modified form, the "rather curious" problem concerning the explanation of the inverted commas is discussed in connection with them, mainly in order to prove that neither Russell's own former theory nor Frege's theory of sense and reference is able to adequately explain how George IV could ever have been curious about the possible identity of the author of *Waverley* with Scott.

Reference to Frege is also made in another part of OD, the second part in which his view on the problem of non-being is discussed *together* with Meinong's theory of objects. After having explained how sentences in which definite descriptions occur may be reduced to sentences in which they do not occur, Russell introduces this second part by saying:

Why it is imperative to effect such a reduction, the subsequent discussion will endeavour to show.

The evidence for the above theory is derived from the difficulties which seem unavoidable if we regard denoting phrases as standing for genuine constituents of the propositions in whose verbal expressions they occur. (Russell 1905 d, p.418)

From the use of the word "imperative" it may be inferred that Russell's attitude towards the ToD had been subjected to a considerable change. Evidently this is due to a new discovery made shortly before OD was written, namely that the problem of non-being, which happened to be ignored in OF, puts the ToD in a much more favourable light. It reveals an unsuspected advantage of the new theory and at the same time, as its counterpart, the disadvantage of the presupposition Meinong or the quasi-Meinongian Russell and Frege or the quasi-Fregean Russell have in common.

Which advantage does Russell have in mind? It is mentioned as such in the previous paragraph (OD, p.418). According to the ToD a proposition expressed by a sentence of the form “The S is P” cannot be *true* unless the denoting phrase “the S” actually denotes something, i.e. unless there is some entity *e* which is such that the proposition expressed by “The S = e” (which has to be construed according to the paraphrase proposed by the ToD) is true (p.423). From this it appears that the denotation is actually allowed to play some role of importance. But, and that is the distinctive feature of the ToD, this role is supposed to be *limited* to actual truth or falsity. The damage caused by the absence of the denotation will be limited accordingly. In the case of propositions expressed by simple sentences of the form “The S is P”, it merely results in their *falsity*, which of course does not prevent propositions *about* such relatively simple ones, i.e., propositions in whose verbal expression “the S” has a *secondary* occurrence, to be sometimes true.

We now know *what* is supposed to be an advantage, but not yet *why*. The answer is rather obvious: There will be no truth-value gaps anymore. If we suppose, just as the quasi-Fregean Russell did, that “Zeus” is a definite description in disguise, say “the Z”, and if we suppose as well, for the sake of argument, that all sentences in Greek mythology containing “Zeus” are of the form “The Z is P”, then they are all false. As far as this point is concerned, we have returned to the view of the quasi-Meinongian Russell. There is, however a significant difference. For now we are able to say that Zeus *is not*, without contradicting ourselves and without any need to transcend the realm of being. We simply say that for any entity *e* the proposition expressed by “The Z=e” is false. The gist of the matter is that the true proposition expressed by “Zeus is not”, which indeed *seems* to be about something without being, is in fact a proposition about something *else*, namely the real falsity of an infinite number of real propositions. Neither Meinongian unreal objects, nor Fregean truth-value gaps are involved.

As seen from the perspective of this much longed for freedom of speech, both Meinong and Frege appear to labour under the same constraint. For trusting appearances, they both *overrate* the importance of the denotation in supposing that it belongs to the *subject matter* of the proposition. They both assume as a matter of course that a sentence such as “The smallest prime number is even” does express a proposition *about* the number 2. This number, they think, *must* be available in order to safeguard the proposition’s being true or false at all. If it were not there, the proposition’s being a genuine proposition would be *impossible*. In this respect they regard the denoting phrase “the smallest prime number” as “standing for a genuine constituent” of the proposition.²⁵

As soon as another example is considered, say “The greatest prime number is odd”, the peaceful unanimity between Meinong and Frege suddenly gets disturbed. Meinong believes it does express a true proposition about an unreal object. Frege refuses to admit unreal objects and supposes the thought expressed by this sentence to be neither true nor false.

What is the source of their controversy? Is it due to the fact that making the distinction between sense and reference, or something like it, is much more important to Frege than it is to Meinong? The author of OD seems to suggest this:

The above breach of the law of contradiction [involved by Meinong’s view] is avoided by Frege’s theory. He distinguishes, in a denoting phrase, two elements, which we may call the *meaning* and the *denotation*. (Russell, 1905 d, p.418)

In saying so, Russell puts the reader on the wrong track. For evidently, Frege took an un-Meinongian stand long before he introduced that distinction, and Meinong could quite well have made a similar one without renouncing his theory of objects.

There is, however, a grain of truth in Russell’s misleading suggestion, namely that the disagreement between Meinong and Frege is somewhat mitigated and covered up, if both are allowed to make use of the distinction. Meinong’s unreality claim would be weakened, for he could say that after all there is something real behind the phrase “the greatest prime number”, namely its *meaning*. And in the same way, the damaging effect of Frege’s refusal to accept unreal objects is actually toned down, for it only regards the *reference*, not the sense. But the main reason why Russell is prepared to make both the reader and himself believe that Frege is able to avoid Meinongian contradictions in virtue of his distinguishing sense from reference, is quite different. It is rather autobiographical than systematic. In using Frege’s name, Russell not only has Frege in mind, but his own former self as well, i.e. the quasi-Fregean Russell who actually hoped to get rid of his own un-essentialist quasi-Meinongianism by means of the distinction between meaning and denotation (see 3.2).

What, then, is the real source of the conflict between Meinong and Frege? It is to be found in the very presupposition they share. For the assumption that the denotation, if there is any, has to play the role of subject matter, has two mutually opposed sides, namely that *if* there is truth or falsity, the denotation must be present and *if* the denotation is absent, there can neither be truth or falsity. According to the law of contraposition these

two implications imply each other; they are equivalent. This equivalence seems to imply that their difference is logically irrelevant. But such a view is not acceptable, for in their actual *application*, they *exclude* each other. Of course, the two-sided principle itself cannot decide how it is to be applied in a particular case such as the above-mentioned example. But as soon as in virtue of other considerations a decision is made in favour of the proposition's capacity to be false or true or in favour of the complete absence of the denotation, then it actually can be applied. Meinong argues: There is truth or falsity, in this case even truth, *therefore* "the greatest prime number" must have a denotation. Frege, on the contrary, having rejected this conclusion, concludes that Meinong's premise *must* be wrong: There is no such number; *therefore* there *can* be no truth or falsity either.

It is quite evident, that in drawing this conclusion, Frege makes use of the hypothetical principle that if there is no denotation, then there is no truth or falsity either. But as I have noted above, this principle amounts to the same as the one actually used by Meinong. This other side of Frege's presupposition will be less evident as long as it remains unused.²⁶ That is the reason why I'll call it *crypto-Meinongianism*. In the same way, an epigone of Sartre, who argues "We are free, therefore God does not exist" could be called a crypto-Calvinist.

At first view, an unrestricted use of the prefix "crypto" seems inappropriate. It sounds strange to apply it to Meinong himself. In my opinion however, there is a good reason to allow such usage. For although it may be manifest that Meinong actually makes use of a general hypothetic principle whose application leads to ontological extravagance, it is much less manifest, that in virtue of its having a backside, it can be shared by those who, like Frege, aim for ontological parsimony. The sticking point is, that crypto-Meinongianism is general and yet distinctively Meinongian.

As seen from the perspective of the ToD, crypto-Meinongianism is to be found almost everywhere, most notably in the very principle of Russell's own realism. What is more, crypto-Meinongianism in fact amounts to the same as Russell's own *reflexive determinism* set out in 1.2. And it is of course also to be found in his quasi-Meinongianism, as appears from the first sentence of the passage quoted in 3.1: "Homeric gods, chimaeras.....all have being, for if they were not entities of a kind, we could make no propositions about them." Therefore, the general tenor of the official story deserves much more credit than generally supposed. By means of paraphrase the ToD purports to reveal that the real subject matter of propositions is different from their apparent one. In that way it seems to be able to

leave undamaged the realm of truth and falsity without being committed to ontological extravagance.

4.3 *The official story as ideological distortion of the facts*

How much truth is contained in the official story and how much falsity? As applied to the first five points enumerated in 0.3, this question may be answered as follows:

Ad a1) Three forms of Meinongianism are to be distinguished: trans-realism, which represents the outgoing and excessive character of Meinong's view, essentialism which is restrictive and realist in tenor, and finally crypto-Meinongianism which is neutral as to the distinction between real and unreal. As far as true and false propositions are supposed to be equally real, only the latter variety of Meinongianism may give rise to an "unduly populous realm of being".

Ad a2) Trans-realism is incompatible with Russell's realism, but something like it is not. Such a quasi-Meinongianism actually occurs in *Principles*. It is out-and-out anti-essentialist and it presupposes crypto-Meinongianism as applied to proper names.

Ad b1) There is no manifest essential link between Russell's actual quasi-Meinongianism and his theory of denoting concepts. The only manifest link is accidental: the theory of denoting is essential to its removal. But crypto-Meinongianism is essentially connected with both. Therefore, at least according to Russell's own later view, the quasi-Fregean attempt to avoid quasi-Meinongianism is doomed to failure.

Ad b2) In fact there are two different desires involved. Neither of them is occasioned by the discovery of a difficulty in the old theory of denoting. The first, rather superficial, desire arose in 1903 and seemed to be satisfied by a Fregean use of that theory. The second, latent and deeper, desire grew stronger at the very moment Russell realised that the previously conceived ToD could satisfy it.

Ad c1) Although the conception of the ToD *could* have been occasioned by that discovery, i.e. the discovery of crypto-Meinongianism, in fact it has been occasioned by a trans-Fregean attempt to avoid a problem borrowed from the orthodox Frege, the problem connected with the notion of indirect sense. And although the discovery of crypto-Meinongianism did in fact not lead to the *conception* of the ToD, it actually contributed to its *adoption*.

According to this analysis, each of these five points contains both truth and falsity. And the discrimination of truth from falsity is based on distinguishing three forms of Meinongianism and two forms of 'being led' to the ToD. Not making these distinctions is what the official and the unofficial view have in common. Whether it leads to the one or the other perspective merely depends on the way these confusions are arranged. For example, if Meinongianism in general is identified with crypto-Meinongianism and 'being led' to the ToD with accepting it, then the official story thus far seems to be mainly justified. If on the other hand Meinongianism in general is identified with essentialist trans-realism and 'being led' to the ToD with conceiving it, then the conclusion will inevitably be in favour of the established criticism.

The last two elements of the official story differ in character from the preceding ones. For it is not possible to find both truth and falsity in any of them. Point c2), the contention that the ToD was accepted as a matter of course, is false anyhow. For initially it was rejected and afterwards the discovery of its advantage in connection with the Meinongian problem of non-being, contributed to its acceptance.

Therefore one and only one question remains to be discussed, namely whether the said discovery was *sufficient* to give rise to Russell's full and wholehearted acceptance of the ToD. There are, as far as I can see, only two possibilities. Either it was sufficient or it was not. In the first case the discovery that the eliminative approach proposed by the ToD might be helpful to solving the paradox, actually took place *after* its full adoption. Then the last element of the official story, point c3), must be wholly true. In the latter case there is, as far as I can see, one and only one discovery that could have completed the process of adoption, namely the said discovery of the link with the paradox. Then point c3) must be wholly false. The joint weight of the following four arguments is, I presume, sufficient to prove at least the plausibility of the latter alternative.

- 1) The mere fact that in OF the ToD is rejected cannot be denied. But its importance could be denied in arguing that Russell's initial lack of enthusiasm is only due to his not yet being able to cope with the revolutionary character of his brand-new theory. At that moment, it could be argued, he did not dare to take the only decision required for its full acceptance: giving up all former attempts to explain the variable by means of denoting and accepting it as

fundamental and irreducible. And that is exactly what is expressed in the fourth paragraph of OD (p.416).

Indeed, but the nature of both this decision and the theory which it is supposed to support, remain unclear as long as the question, mentioned in 4.1, whether the variable does or does not have any meaning on its own account, is answered. For the very essence of the ToD consists in its claim that the real subject matter of a proposition in whose verbal expression a denoting phrase occurs is different from its apparent subject matter. Indeed, Russell is very emphatic in arguing that the denotation is *not* something the proposition is about and that in fact it plays *another* less important role. But he is much less emphatic about the equally essential question which other entities actually play the role wrongly attributed to the denotation. In order to deny the variable's independent meaning, Russell has to disavow the radical pluralism implied by his realism and with it the idea of the unrestricted variable. And in order to accept that the variable does have any meaning on its own account, he has to face the following, rather nasty dilemma: either the former distinction between meaning and denotation is applied to it, or it is not. If it is, the ToD's being subordinate to the old theory of denoting concepts becomes apparent. If it is not, the ToD appears to be in flat contradiction with the principle of finite human acquaintance (see 3.1). For in that case, a proposition expressed by a sentence containing a denoting phrase will have to consist of infinitely many constituents. And in order to understand it, we will have to be acquainted with all of them.

- 2) The general tenor of OD is much less unambiguous than generally supposed. This appears from its last paragraph. There Russell concludes his argument in saying:

I will only beg the reader not to make up his mind against the view [of the ToD] -as he might be tempted to do, on account of its apparently excessive complication - until he has attempted to construct a theory of his own on the subject of denotation. This attempt, I believe, will convince him that, whatever the true theory may be, it cannot have such simplicity as one might have expected beforehand. (Russell, 1905 d, p.427)

At first sight this passage seems to be open to no other than one of the following two interpretations: either it is just the umpteenth testimony of Russell's gallantry, or it is meant to express an inevitable consequence of the fact that the argument in favour of the ToD cannot be final because the number of puzzles used as its test cases is limited anyhow. According to me however, another, less obvious interpretation is possible: Russell's concluding remark reflects the hidden structure of OD as a whole. The main reason, why underneath OD's apparent structure another is concealed, is as follows. If in view of a certain puzzle it is argued that the new theory is able to solve or to avoid it and the old one is not, then such a twofold argument, provided it is valid, seems to prove that the former theory has an *unambiguous* advantage whose scope is *limited* to the puzzle in question. But – and that is the sticking point – as soon as in the course of the critical part of the argument, in some way or other, the question is touched *why* the old theory fails, the said principle does not hold any longer. For in that case there are two mutually opposed possibilities: Either the critical argument purports to prove that the old theory fails *in virtue* of its deviating from the new one, or it leaves the said failure *unexplained*. In the first case the criticism contends to give *unlimited extra support* to the new theory. In the latter case, the argument, in virtue of its concession not to be able to give such an extra support, casts a possibly unlimited *shadow* on the viability of the new theory. This opposition is actually exemplified by the two critical arguments contained in OD, as appears from the use of the word “imperative” in the introduction of the discussion with Meinong and Frege (see 4.2), and the use of the words “rather curious” in the introduction of the so-called Gray's Elegy Argument (GEA).

- 3) Just as OD differs from the very first unofficial account of the ToD in virtue of containing a criticism of Meinong and Frege in view of the problem of non-being, so it differs from later expositions of the ToD in virtue of its containing the GEA. From *Principia* onwards all expositions of the ToD make instead of it use of another argument which purports to take away any possible doubt concerning the cause of the old theory's failure to solve the problem of informative identity:

Thus all phrases (other than propositions) containing the word *the* (in the singular) are incomplete symbols: they have a meaning in use, but not in isolation. For “the author of Waverley” cannot mean the same as “Scott,” or “Scott is the author of Waverley” would mean the same as “Scott is Scott,” which it plainly does not; nor can “the author of Waverly” mean anything other than “Scott,” or “Scott is the author of Waverley” would be false. Hence “the author of Waverley” means nothing. (Whitehead and Russell, 1910, p.67)

Whatever the possible validity of this argument may be, it claims to give extra support to the ToD on account of the problem of informative identity. And it does so without taking the possible distinction between sense and reference or meaning and denotation, let alone the one between direct and indirect sense, into account. Therefore, it can be put forward without mentioning either Frege or the Russell of *Principles*. And that might be a great advantage, for it implies that the critical discussion of their theories, most notably the GEA, is irrelevant to ToD’s philosophical justification. And, as I have argued in 4.2, the same holds of the critical argument against Meinong and Frege set out in OD. This might explain the remarkable fact that in all expositions of the ToD from *Principia* onwards, Frege has disappeared from the scene; only Meinong remains.

- 4) As I have argued in 0.2, any plausible account of the history of the ToD must be such that the very emergence of the distortions contained in the official story may be dealt with as an explainable historical fact. Therefore, the true story must contain at least one element which can neither tolerate public daylight, nor even the daylight of Russell’s private consciousness. As far as I can see, there is one and only one element that could possibly be supposed to meet this requirement, namely that the ToD was not fully accepted until the link with the paradox was discovered. For the full acknowledgement of that fact would of course cast a shadow on the viability of Russell’s attempt to solve the paradox.

If this hypothesis is right, the connection between the ToD and the paradox is even more important than the official story suggests. And its being more important is due to the fact that the ToD and its final adoption are much more pragmatic than Russell is

prepared to admit. The distortions contained in the official story are not due to its overstressing the importance of Meinong, for that can be justified by means of the notion of crypto-Meinongianism, but rather to its neglecting the equally important role of Frege. And this negligence springs from the attempt to ignore whatever obstructed or postponed ToD's full acceptance. Indeed, the ToD paves the way to a fundamentally new perspective: free realism, but its justification is much more problematic than the official story suggests.²⁷

¹ Actually Berkeley says: "Their *esse* is *percipi*", i.e. the being of "unthinking things" or ideas is being perceived, whereas the being of thinking things consists in perceiving (*percipere*). See Berkeley (1710), p.259.

² See Russell, 1905 d, pp.482-483, Whitehead and Russell, 1910, p.66, Russell, 1911, p.162, Russell, 1918, p.248 and Russell, 1919, p.169

³ The actual history of this reception is rather complicated. In Russell 1903 b, p.319 Meinong's view is adopted in a somewhat modified form which evidently is inspired by Frege's idea that the distinction between sense and reference can be applied to sentences: A true proposition denotes a fact, a false one denotes nothing. In Russell 1904, pp.471-474 this theory is rejected and in OD it is adopted again (see Russell 1905 d, pp.490-492). It paves the way to the multiple relation theory of judgment conceived some years later. See: Russell 1909, p.151, where reference is made to Meinong.

⁴ Such a reflexive argument is typical of Russell's realism. See section 1.2

⁵ For further discussion see 2.1 and 4.3 below.

⁶ See Meinong, 1904, p.4.

⁷ See Russell, 1897, pp.64-66.

⁸ Such an analysis is based on the Aristotelian principle that the more universal only exists in its less universal specifications. A 'generic' universal such as 'coloured' is supposed to have no other being than being embodied in specific ways of being coloured, such as being red. This principle is denied by Russell. See Russell 1903 a, p.138: "Redness, in fact, appears to be (when taken to mean one particular shade) a simple concept, which, although it implies colours, does not contain colour as a constituent."

⁹ Russell takes the notion of existence, borrowed from traditional metaphysics, as wide as possible. If something is really in space and time or only in time, it exists. If space and time and the points or moments they consist of, are real, they exist as well. See: Russell 1903 a, p. 449: "Both being and existence, I believe, belong to empty space." Finally, if God really is, then God exists in spite of His being beyond time. See: Russell 1905 a, p.486, where the "super-sensible existence attributed to the Deity" is mentioned in this connection.

¹⁰ I concede that in the case of chimaeras this interpretation is less plausible, because, as far as I know, they lack proper names. I do not think however, that this difficulty is serious enough to prove that Russell never could have held the view I attribute to him. In fact, he is not primarily concerned with language at all. His main argument is rather, that if a definite chimaera occurs in a certain story, then denying the existence of that particular chimaera would be impossible unless the story is really about some *entity*. And every particular entity which actually is presented to the mind *can* be mentioned by means of a proper name.

¹¹ See Russell, 1899, p.143 and Russell, 1959, Ch.5, where "a paper read to the Aristotelian Society in 1906, which deals with Harold Joachim's book on *The Nature of Truth*", is extensively quoted.

¹² See Russell, 1897, pp.185-187.

¹³ This point is discussed in Russell's famous letter, written the 12th of December to Frege. See: Frege 1976, pp.250-251.

¹⁴ See B. Spinoza, *Ethica*, Part I, Axiom 1: "Omnia, quae sunt, vel in se, vel in alio sunt." (Whatever is, either is in itself or in something else).

¹⁵ That is why Russell was able to make a "Revolt into Pluralism" from a pluralist position. And that is also the reason why his respect for Bradley's monism increased in direct proportion to his being dissatisfied with it.

¹⁶ Russell was well aware of this difference. See Russell 105 d, p.419, footnote 9.

¹⁷ Frege, 1892, p.148-149.

¹⁸ My use of the opposition between freedom and constraint is borrowed from Quine (1948).

¹⁹ Frege, 1884, §46, p.59.

²⁰ See for Frege's view: Frege, 1879, p.2-3 and for its denial, although without any reference to Frege: Russell, 1903 a, pp.228-229.

²¹ Frege, 1879, p.17.

²² See for further discussion 4.3, point 3).

²³ See: Russell 1903 b, pp.320-321 and Russell, 1905 c, p.363.

²⁴ Frege, 1884, §78, point 4, p.91.

²⁵ And Frege or the quasi-Fregean Russell do so *in spite* of their emphatic claim that the denotation is *not* a constituent of the proposition. As seen from the perspective of the ToD, this claim does not express anything more than a good but powerless intention. That is why it is ignored by the author of OD.

²⁶ But in fact it is also used in Frege, 1893, pp.18-20, where an arbitrary reference is assigned to denoting phrases which in their ordinary usage would be vacuous. In this way Frege's crypto-Meinongianism becomes manifest. In order to prevent truth-value gaps from intruding into his concept-script, Frege needs an object to fulfil the supposed role of the denotation. And that is exactly what is meant in OD, p.420, where Russell says: "Another way of taking the same course [i.e., the one taken by Meinong] (so far as our present alternative is concerned) is adopted by Frege, who provides by definition some purely conventional denotation for those cases in which otherwise there would be none."

²⁷ The paper I presented at the *Russell versus Meinong: 100 Years After 'On Denoting'* conference at the Bertrand Russell Research Centre, Mc Master University, 14-18 May, 2005, will appear elsewhere (see Boukema, 2005). The general tenor of the present paper is essentially the same, but it approaches the subject matter in a different way: from the perspective of Russell's supposed 'Meinongianism'. I would like to thank Peter Simons, Gregory Landini, Russel Wahl and Gideon Makin for their comments on the first paper, Graham Stevens for the long-lasting resistance offered in subsequent discussions about the nature and the possible reality of Russell's 'Meinongianism' and Peter Seuren for correcting my English.
